

A Report on Lake Ontario's Microbes

Augustus Pendleton

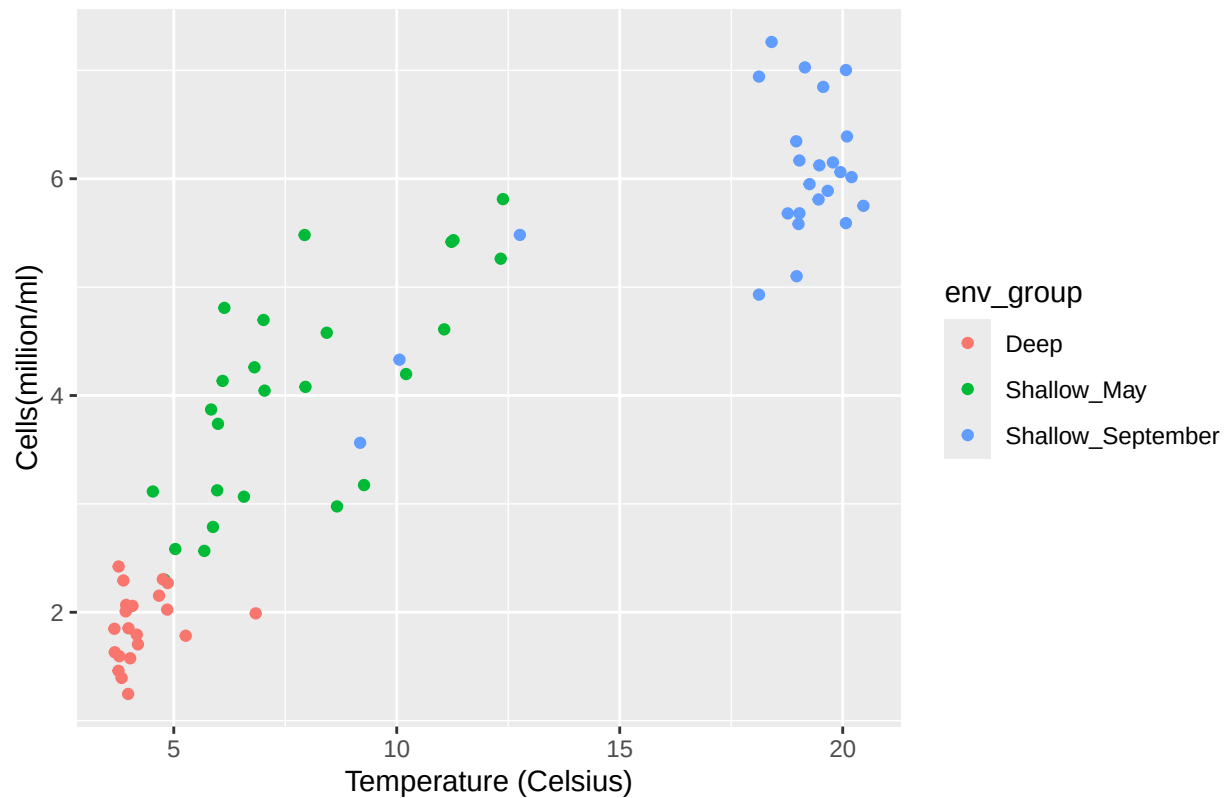

01/14/2025

This report was prepared to analyze environmental and microbial data from Lake Ontario. Our goal is to determine to how environmental variables like temperature affect the abundance of different Phyla of bacteria.

```
sample_and_taxon <- read_csv("data/sample_and_taxon.csv")
```

```
## Rows: 71 Columns: 16
## -- Column specification -----
## Delimiter: ","
## chr (2): sample_id, env_group
## dbl (14): depth, cells_per_ml, temperature, total_nitrogen, total_phosphorus...
##
## i Use `spec()` to retrieve the full column specification for this data.
## i Specify the column types or set `show_col_types = FALSE` to quiet this message.
```

Are temperature and cell abundance linked?

The above plot shows the relationship between cell abundance and temperature for a total of 71 samples. For this set of samples, temperature ranged from a minimum of 4°C to a maximum of 20°C.
